Subject QUESTIONS AND REQUEST Thanks!

Hi everyone,

Many of you had a chance to see the picture of rash all over my back which occurred in late 2011.

It was mentioned to me yesterday by OHA that a possible cause for that kind of reaction may not have come from herbicides ,but fungicides,which are classified as organochlorides.

I do remember that several months after that I was experiencing sharp pains through by breasts,and started to research on the correlation between breast health and organochlorides.

I found out that these toxic compounds can be stored in breast fat and in some cases were linked to breast cancer.

This leads me to make a reasonable request :

1. The investigative team should find out what kind of fungicides,rodenticides and insecticides we may be exposed to along with herbicides we already know about.

2. Recently Stu Turner has brought it to our attention that 80 % of fungicides,insecticides application in Oregon is done through fix wing airplanes that fly "corner to corner" ,meaning they are up there high in the air and treating the clear cut new seedlings from a very high elevation ,not flying down hill of course ,but spraying again in his words "four corners". He said that he learned this information at the recent industry conference and that he was shocked to hear that.

He acknowledged that this application would cause major drift (due to high spray elevation) and waste a lot of material and that he was shocked at what he learned that day.

QUESTIONS:

A. Is there a way to check into this and get details about these kind of operations?

B. HOW WOULD THIS PRACTICE BE LEGAL?

C. Is it legal for this operations to be going on under EUP's (Experimental Use Permits) issued by EPA or ODA?

Please let us know.

Thank you,

Marijana

p.s. I prefer this e mail not be e mailed to ODA and ODF personnel because of our distrust in the individuals and higher ups representing those agencies at this time.
